The first mainframe version was released in September 1985. AutoCAD Basic introduced most of the features of later versions of the software, including the ability to draw and modify 2D and 3D objects. It also included an initial drawing canvas of 250 x 250 points and no pre-drawn objects, unlike all of the subsequent editions. AutoCAD LT was introduced in March 1991 as a simplified version of AutoCAD. It was followed by AutoCAD 2.0 in February 1992, which added several new features such as zoom, snap and zooming options, and unit support. AutoCAD 3.0, was the first version to be available for the PC, and the first version to support more than one Windows graphics device, meaning that a single AutoCAD license could be used on a PC and on multiple graphics devices at the same time. AutoCAD was originally released with X11 windowing and can still be used with Windows API-based windowing. The first AutoCAD 3.0 version released on Windows 3.1, and subsequent releases are available for Windows 95 and NT. AutoCAD 3.5 was released in August 1997. AutoCAD 4.0, was released in April 1998. The basic version is compatible with AutoCAD 3.5, 3.3 and AutoCAD LT, but subsequent versions of AutoCAD (4.x) are only available for Windows and include all the features of AutoCAD and AutoCAD LT. AutoCAD LT 3.5 was released in April 1999. AutoCAD Graphics (previously known as 'AutoCAD XL') was the first version of AutoCAD that supported 3D objects and was released in September 1999. Later in the same year, the latest version of AutoCAD,

File format AutoCAD Activation Code DWG files contain a header section, where the file's version, units, geometry, attributes, title, author, comments, and drawing type are stored. The geometry is a CAD library containing one or more blocks of information. The drawing type is a tag identifying the format of the data stored in the blocks of information. AutoCAD Activation Code DWG and DXF files can be saved and reused. To save, enter Save As. For instance, the Save As option provides the following submenu options for saving a CAD drawing: Open existing drawing New file from template Open existing template Create new template (DWG/DXF) If the drawing file format is.DWG then a template will be opened with the template options that are saved with the drawing and can be used to open the same drawing again. If the file is a DXF file then an existing template may be opened for the same drawing. Template options and controls AutoCAD has a number of pre-defined templates which users can apply to a drawing to enable common actions to be performed on the drawing. On the Windows operating system, templates can be set by right-clicking a drawing, choosing Select, then open with to open the Select dialog box. Then, templates

can be selected from the list and applied by selecting the check box. With the 2008 release of AutoCAD LT, the function of the Select and Open With command has been moved to the Template tab of the Options dialog. Template setup is the process of setting the selection and attributes of the template which is applied to the drawing. To select a template for an object, click the Edit command on the tool bar and choose Templates. The Select dialog box displays the list of templates. The list is categorised by drawing type. There are four categories of drawing types: AutoCAD DWG, AutoCAD LT DWG, AutoCAD LT DXF, and DXF/DWG. The templates in the list are categorized by drawing type. On the right of each category is the template list. This will open when the template list on the left is open. The list is organised into a table by drawing type. There is one row for each drawing type, and within this is one column for each template. Select the template to be applied by clicking its check box. The Templates option on the Options dialog has

Support for Adobe Dynamic Link to import files. Added support for Adobe LinkShare that provides an easy way for users to share links to DWG files for the most popular drawing software used by architects and engineers. Added support for new CIP (consolidated import parameter) files that can be used to consolidate the information in the DWG files, such as section lines, elevation lines, and rendering parameters. You can even use the same CIP file to import multiple DWG files for one project, as long as you send the CIP file as a separate file. Added support for DWG and SVG file formats. Added support for drawing creation, annotation, and annotation management. Added support for interactive 3D drawing with the 3DS format. Added support for Autodesk DWG eXchange (DXF) files that can be used to quickly share files between users with different drawing
