The tagline of Autodesk's marketing materials is "Drafting made easy". In order to say drafting has been made easy, you need to consider a few things. Firstly, it is not about a particular technology or one-size-fits-all solution. The distinction should not be between a design tool and a drafting tool, but rather between more simplistic and complex drafting methods. The differences can be argued back and forth and are a part of any good discussion about the topic. Secondly, drafting has historically been the domain of skilled people who know how to use a tool (e.g. a pen, pen plotter, or laser cutter) and have developed their own approaches to design through practice. Consider the below chart of attributes of drafting methods (also used by industry) relative to their proficiency level required to be successful with them. As you can see, drafting is not a one size fits all process and proficiency level required to be successful with it will vary. A proficient carpenter can also be a novice draftsman. For more than a decade, New York has been working to improve the quality of life for working people and the poor through strategic policies designed to support vulnerable communities. Over the past two years, we have seen the private sector begin to share the wealth with our community, with corporate tax reform, city economic development incentives and government contract job creation. These reforms will support workers and families in distressed communities. But while some groups may see some of these reforms as a threat, most city residents are actually thrilled to be seeing the private sector take a larger role in the city and delivering jobs. Rochester's economic development is now firmly in the private sector. The idea is that private capital will develop and invest where the economic opportunity is and where it will have the greatest return. It is an idea that was created to benefit the city's poor and working people. As the city's economic development has become increasingly private, Rochester's economy has improved, especially for low-income households. Rochester's economic development has focused on making the city more attractive to investment so that the community's resources can benefit those with the fewest resources. But the city has also focused on low-income residents. It has concentrated on improving health care, improving transportation and making housing more affordable. What does this mean for New York City? For one, it means that we can achieve much of what we want to achieve, that is, to improve the city's economy and quality of life, without closing schools and laying off public employees, and without strangling our economic growth with high taxes. We can achieve these goals by harnessing the private sector and capital to create jobs and improve our economy while providing better quality of life for our residents. And we can do this by developing an investment climate that creates jobs and improves conditions for working people. Some of the provisions of New York's economic development law that should encourage job creation by expanding the private sector include: ■ Stronger enforcement of contract specifications, including stronger enforcement for minority and women-owned business; ■ Increased tax incentives to attract and retain businesses; ■ Weaker regulations on business, including the cap on the number of workers that can be based in the city; ■ Ability to raise the minimum wage without requirement to negotiate with the union; ■ Laws to promote more flexible employment practices; ■ A tax credit to encourage

employers to create apprenticeship programs
