## Catalyst

A browser is a tool just as essential as a file explorer for the computers of today take away the internet and the ability to tap into web browsing, and the versatility of a computer is greatly hampered. Of course, some of that is owing to our reliance on the internet as a whole, but a good browser can make the web surfing experience that much more pleasant. Respecting user privacy should be of paramount importance to any browser developer, so any initiative specifically aimed at providing a tracking-free and privacy-first approach is worth appreciating. Catalyst seeks to provide that and more for its users. A minimalist take While the mainstream browser solutions have all but nudged us in a certain direction in regard to how browsers should look and operate, Catalyst is a bit of a departure in that sense. Sure, it operates much like the browsers we're all familiar with: browser tabs, search and bookmarks bars are all there, but their design is much more different from what you'd see on Chrome, Firefox, or Edge. Simply put, the browser adopts a sort of quasi-minimalist design, where the interface prioritizes a clutter-free experience over anything else, while ensuring there's enough space to make the tabs and bookmarks easily recognizable. Hence, tabs and bookmarks are of a generous size, allowing the users to clearly manage and navigate through their favorite websites. The default search engine is DuckDuckGo, which is widely considered to be a safer, more privacy-focused alternative to Google. While typing in the search bar, DuckDuckGo Autocomplete will provide you with results as you type, but you can turn that off in the Preferences menu anytime. Additionally, you may choose to have the browser hide or display the bookmarks bar. Growing pains The mainstream browser solutions are popular mostly due to convenience: the performance is satisfactory, they're constantly updated to support new functions and patch security problems, and the add-ons and their communities are constantly evolving. Smaller-scale solutions like this one usually experience growing pains in those areas: the updates and security aspects seem to be just fine here, but what of extensions/add-ons? The lack of extensions might be a deal-breaker for some, and that's perfectly understandable. While the browsing experience is snappy and everything works as intended, you can't help but feel that something is missing. In conclusion From a privacy-first standpoint, Catalyst is a web browser worth your while

## What's New in the?

Catalyst is a web browser that aims to be a privacy-first browser by not tracking, not indexing websites and no more than sending data to them. (Montreal, July 15, 2019) The scientific community has heralded the CRISPR-Cas9 gene-editing technology as a way to enhance crops and advance the practice of medicine, but more broadly, to the advancement of life in general. Now, however, a study has uncovered a disturbing truth: A third of the research papers CRISPR-Cas9 has been used for over the past five years were published in just a handful of journals, and those journals made the papers disappear from open access databases like PubMed, where they would have been accessible to everyone. As a consequence, the first CRISPR-Cas9-modified human embryos have been generated at UCLA, and the first birth via CRISPR-Cas9 assisted reproduction has taken place at Oregon Health and Science University. The analysis of Open Access Journals and CRISPR-Cas9 Papers: The Case of Drosophila by Dr. Kavita Ramdani of Indiana University Bloomington shows that over the last five years, there has been a 61 percent increase in CRISPR-Cas9 papers in eLife, published by the open access publisher eLife, while the number of papers published in the seven other journals has increased by just 3 percent. The proportion of CRISPR-Cas9 papers in eLife has increased from around 5 percent in 2014 to between 20 and 30 percent of CRISPR papers now. And it's not just the U.S. that has become obsessed with CRISPR-Cas9: According to the analysis, more than half of CRISPR-Cas9 papers were published in China and Russia, with around 10 percent being published in India and the remaining 30 percent coming from eight other countries. The researchers suggest a lack of academic incentives in the U.S. to publish CRISPR-Cas9 papers in journals that make them open access, as well as questionable research practices that may be causing researchers to apply for patents on CRISPR-Cas9-based applications. If true, these results will not only profoundly impact the speed with which CRISPR-Cas9 gene-editing becomes the first choice for many research scientists, but also the way in which research is funded and conducted. Advancing science The CRISPR-Cas9 gene-editing technology is a revolutionary tool, and one that could fundamentally change how we live our lives and advance our humanity. In 2015, the researchers who first developed it were awarded the Nobel Prize for Physiology or Medicine. CRISPR-Cas9-based research is being used to treat diseases, cure genetic disorders, to develop methods to eliminate cancer and fight AIDS, and ultimately, to end suffering. More broadly, CRISPR
