Now, scientists and health officials are watching test results closely to learn whether mosquitoes have been infected. "We know there have been cases," said Dr. Robert Black with the University of Texas Medical Branch. "I want to reiterate we don't know if this is Zika." Between 8,000 and 17,000 possible Zika cases have been confirmed in the United States, according to the Centers for Disease Control and Prevention. In April, 16 men in Mexico tested positive for the virus, and last year, 13 men in Brazil tested positive for the virus. After the woman was buried in December, the doctors that treated her case told CNN they found high levels of a chemical with the Zika virus inside her tissue. Dr. Sofia Boelaert, an infectious disease expert at the University of Cambridge, believes the virus likely traveled through a mosquito bite. "As she is from a village in Brazil, where Zika is endemic, we know that is how the majority of infections happen," she said. JUST WATCHED Zika: Why are they calling it a South American epidemic?
