A: The other approach that you can use is to set strings in Application Settings Bundle when you create the bundle. For example, if you want the bundle to be read-only, you can use the following: `Settings.bundle.localizedString("key", forKey: "value", tableName: "NameOfTab", value: "Localized String")` For simplicity, I'll show an example for the key and the value: `Settings.bundle.localizedString("someKey", forKey: "someValue", tableName: "NameOfTab", value: "Another String")` If there are some codes after the value in your description, you should add them and replace them with same text in the bundle. Later, you can load the bundle and use the keys to access values like that: `Settings.load().valueForKey("someKey")` If you want to save them, you should save them with `UserDefaults: Defaults.standard.set(Settings.load().valueForKey("someKey"), forKey: "someKey")` That's it, if you want to store other information or text, use the functions that I've listed before. Hope it helps.

Plant height and shape variability associated with a single cytoplasmic factor.

1. The influences of several cytoplasmic factors affecting plant height and shape were studied in a single cross between members of two closely related species of Zea.
2. The degree of association between parental cytoplasmic effects and offspring phenotypes could be the result of interactions between the respective loci and/or changes in cytoplasmic gene dosage.
3. Narrow crosses ($XY = Z$ and $XX = Z$) showed phenotypic differences between reciprocal crosses only when the same parent ($XY = XX$) was used. Conversely, for broad crosses ($XY = ZZ$ and $XX = ZZ$), reciprocal crosses ($XXX = Z$ and $ZXX = Z$) produced similar phenotypes.
4. Parental cytoplasm may therefore make a quantitatively but not qualitatively important contribution to the inheritance of plant height and shape in Z. The data indicate that plant height and shape may be regulated by a single gene, for which the Z and a determinate genome are each dominant.
5. Plant height and shape in Z appear to be genetically regulated independently in this cross.
