Samsung galaxy mini plus arabic firmware A smartphone is a portable electronic device that can store and display information, enable a user to communicate and access the internet, and perform tasks associated with the reception and transmission of telephone calls, the storage and playing of music, navigation, and photography. The earliest ancestors of the modern smartphone were a handheld personal computer, a pocketwatch (or wristwatch), and a mobile phone. By the early 2000s, the smartphone had become smaller and lighter, and had more applications. As of June 2017, smartphones were being carried by over 7.5 billion people across the globe. A smartphone is not classified as a computer, but often features a display that curves around the front of the device, commonly with no physical keyboard.[1] These mobile computers are connected to the Internet by data networks running either cellular radio or wired technologies. First generation smartphones had little in common except their internet connectivity. Most early smartphones were feature phones. The display quality improved over time, and smartphones with high-resolution touchscreen displays became the majority by mid-2010s. Other features include a camera or other imaging device that captures digital images and video, an on-screen keyboard for text entry, and a port for connecting to other devices. Some smartphones have a universal port for USB, Bluetooth, or infrared. Some smartphones feature a clock, email client, personal information manager, word processor, spreadsheet, or diary applications. As of 2017, almost two billion people around the world own a smartphone. History The concept of a mobile phone is credited to Alexander Graham Bell, who in the year 1875 filed a patent application for "Telegraphic Apparatus".[3] At the time, the patent application included a demonstration of a handheld telegraph apparatus with a built-in bell. A year later, Bell filed a second patent application for a "telephone with bell, exchange and detector". This second patent application included a further demonstration of the telegraph apparatus with a built-in bell. Bell's portable telephone included a diaphragm which was actuated by a spring-loaded hammer, and attached to the telephone receiver by a cord. A bent piece of wire was attached to the diaphragm in such a way that when the diaphragm was vibrated by a sound wave, the bent piece of wire bent and signaled the telephone receiver.[4] In 1876, Bell filed a third patent application which included the following elements; (1) a "me
