
SteamVR Performance Test Crack +

SteamVR Performance Test is a simple, easy to use application that will test your system and give you the information you need to decide whether or not you should invest in a VR headset. It will calculate how long it will take your system to render VR content at 90 FPS or more, and if you can reach those figures using your current hardware. In case your computer can't handle the VR workload, it will also indicate which components require replacing in order to get higher frame rates. 3 comments Whilst i do agree that a 60FPS threshold is needed, maybe an average over the entire VR workload is better, such as 30FPS average, because there is a lot of content that is pretty low res (i.e. Bad weather level stuff), and the 100FPS is an averaged figure over a short period of time, hence not helping much there. Hi Mike, unfortunately the SteamVR Performance Test application we have available doesn't allow you to specify what frame rate threshold you would like to use. However, if we ever get the chance to implement this feature, we'll let you know as soon as it's available. The other issue with using an average is that the FPS rate drops off rapidly once the game starts up. The reason for this is that the engine is constantly updating all the data for the scene to make sure that the objects look realistic and you are getting a smooth, steady and predictable experience. Hi, what's your problem exactly, it seems you don't have any problem, everything is fine. This thread is locked. You can unlock it by removing the following restriction: "Can't edit posts more than once every 5 minutes" from your preferences. We may have to lock the thread as we are under attack by spammers.
