It can be used to copy data from a source to the destination. Sources: Windows XP, Windows Vista, Windows 7, Windows Vista 64-bit, Windows 7 64-bit Additional Information:

What's New In Win32 Disk Imager?

To create a backup of a USB drive that will be used for imaging purposes, click on the drive that you want to scan. The program will then ask you to select the file that you want to add. Make sure that the drive is properly connected and that the files you want to import are in the folder that you selected. In most cases, you should only need to provide the path to the file that you want to include. At the same time, you may also include any folders that you want to scan. If you want to include the entire content of the drive, click on the "Scan whole drive" button to make sure that you import every file. This will result in a very large file that will take a lot of space on your USB drive and requires a substantial amount of time to copy. This is not necessary in most cases. Once the file has been selected, the program will load the files to an internal list where you can check which ones you want to include. The program will allow you to include or exclude files based on their file type, date modified and extension. For example, you could select all pictures that were added in the last 30 days, even if they are not JPEG images. In order to generate the hash, click on the button in the upper-right corner. A new window will appear where you can select the type of hash that you want to generate. Most programs only support SHA-1 or MD5 hashes. You can generate a list of all available hash algorithms by clicking on the button in the lower right corner. The program will scan all the files of the drive and add the hash to the file that you selected. The new file will be added to the internal list that you can manage. To add the hash to a program, click on the file that you want to include. This will bring you back to the main menu. Choose the option for the type of hash that you want to include. The program does not have any complicated settings and you can perform a scan in seconds. In most cases, it is recommended to perform a scan once a month to check for any changes that may have occurred. The program is easy to use and is compatible with most operating systems and USB drives. Win32 Disk Imager Screenshots: Win32 Disk Imager New Features: Support for drives with larger capacity. New implementation of hash algorithms that are more powerful. Generates hashes of IMG files that can be used to verify the integrity of the file. Win32 Disk Imager Pros: You can restore files from the internal list. Supports USB drives of any size. You can generate a list of all supported hashes. The process can be performed in seconds. Exports the program to a TAR file that can be used with most applications. The program is compatible with most operating systems.
