DAVInspector Screenshot: DD-WRT builds are the only way to use the DD-WRT firmware in the lite edition. None of the source code has been released for the lite edition, so it is only possible to build from the DD-WRT build. DD-WRT builds are the only way to use the DD-WRT firmware in the lite edition. None of the source code has been released for the lite edition, so it is only possible to build from the DD-WRT build. Build from DD-

WRT: The following issues remain in the lite version:

- No RTL8188CE specific patches (or even "lite"-edures) available.
- The Wiki pages are incomplete and confusing, there's lots of incomplete information.
- The serial ports aren't configured by default.

How to build from source:

- Make sure you have the following installed: firmware-mgr-v5 firmware-manager-v5 firmware-optimize-v5

You can use the examples in the buildbot for reference.

- make sure you have these packages installed: open-serial libcurl-4.1.1 libopenssl-0.9.8k libxml2-2.7.8 libpam-1.1.8 libc6-2.10.1 libdb-4.8.30

Where to get: [b7e8fdf5c8](#)

DAVInspector is an application that enables the user to inspect the I/O activities of a WebDAV server. It helps the developer to investigate WebDAV interactions and problems during the application development process. Developer can also use the application to validate a WebDAV client or server against certain tests and to ensure that WebDAV compliant services can be validated. The application lets the user check the completion status of a WebDAV operation, to ensure the correctness of a WebDAV operation. The application also allows the user to know details about a failed WebDAV operation such as the state of a WebDAV operation and whether the error was server or client side. Some parts of the application allows to view and interpret the request and the response of a WebDAV operation. This information can be useful

to identify a user sensitive information or to verify the authenticity of a WebDAV user. The application displays all the WebDAV operations that the user can perform in a tree view (based on the HTTP methods and the path segments provided in the request) and offers actions to each request (such as getting and setting attributes, creating new child items or deleting). You can see information about both the server and the client side. The application shows a status bar that displays the current operation, the current test and the current filter at the top of the main window. The main window can be split in two panels where the upper panel shows all the information about the server and the lower panel shows all the information about the client. The application stores the data that is displayed in a separate database file. This data can be used to build statistics about the WebDAV operation. The application also allows to

trigger a simple WebDAV client to verify the consistency of the WebDAV server. DAVInspector was tested on J2ME MIDP 2.0, MIDP 2.0, MIDP 2.1 and MIDP 2.2. DAVInspector gives you the following capabilities: User can check completion status of a WebDAV operation User can check the success or the failure of a WebDAV operation User can see the details of a failed WebDAV operation User can view the HTTP request or the HTTP response headers of a WebDAV operation User can view all the HTTP headers User can view the HTTP response headers User can view the HTTP request body User can view the response body of a WebDAV operation

What's New in the DAVInspector?

DAVInspector is a tool for debugging and monitoring HTTP and WebDAV capable applications. It will:

- Analyse the HTTP response headers, body and WebDAV responses
- Generate an audit log of the

HTTP responses □ Provide a command line interface that will allow you to inspect, query and control the HTTP response headers and body

DAVInspector Features: □ Check the HTTP headers □ Check the body □

Generate an audit log file of the HTTP and WebDAV responses DAVInspector

Commands: □ net get □ net get url □ net get url -n Name -d Display the response body -v Verbose mode -q Quiet mode -s Enable access logging -z Set the audit log file prefix -X Suppress the default http/1.1 responses -P Change response headers in the audit log -O Change the response status code -o Change the response body -M Change the response body □ Generate a http/1.1 response -h Delete the response header -r Replace the response header -t Add a custom response header DAVInspector

Examples: net get net get url net get url Get net get -n Name net get -n Name -d net get -n Name -d -n Name net get -n

Name -d -v net get -n Name -d -v net get
-n Name -d -v -n Name net get -n Name
-d -v -q net get -n Name -d -v -q net get
-n Name -d -v -q -n Name net get -n
Name -d -v -q -s net get -n Name
