drive along with an entire collection of audio effects. Once loaded and properly routed to audio input and output devices, all sliders become available for use. Sound is processed in real time, with a volume indicator to provide quick visual feedback per channel. There are multiple types of modulators and effects to use, each in its own panel with corresponding sets of controls. Showing up in pairs of three, oscillators, LFO routers, and destroyer components provide individual controls. Oscillators use square, triangle, and sawtooth waveforms, while LFO routers can

---

be fitted with any of them. There's a general filter with ADSR sliders, as well as KBD, envelope, cutoff, and resonance controls. Amplitude is adjusted only through ADSR sliders, while modulation is also fitted with pitch oscillators, and speed LFO routers. More enhancements can be applied through configurable chorus, and delay. GTG ST

GTG MX Advanced Audio Effects Plug-In GTG MX Advanced Audio Effects Plug-In is a generic Stereo API multi-effects plug-in that offers a lot more power, flexibility and creative options than the original GTG Stereo plug-in version 1.0 GTG MX Advanced Audio Effects Plug-In is a generic

---

Stereo API multi-effects plug-in that offers a lot more power, flexibility and creative options than the original GTG Stereo plug-in version 1.0 Features: Multi core architecture for highest performance Native 64-bit support With optimized CPU and memory usage in run-time The ability to use multiple cores at the same time An advanced interface that is easy to use with internal help Now let's dive into some of the coolest features: Routing The plugin has a multilayered paradigm. While every element in the plug-in has a dedicated place in the interface, the routing

---

mechanism depends on the style the user has selected. In “RX” style, it’s possible to route the plugin in real time, without knowing the correct way of connecting elements, while in “Destination” mode the user must either set up the connections by himself or write down the routing instructions in a .gtgx file, ready to be uploaded back to the program. The RX Mode allows the plugin to be a one or two sends one send effect, where each send returns a different output signal. The lower the cut off frequency of the RX Mode is set, the closer the outputs of the plugin will be

---

positioned to one another. This can create a wide variety of out-of-the-box effects, such as a reverb effect that has a tube circuit and EQ out, a compressor and a limiter. The routing supports multiple inputs and outputs (up to 64) The plugin will work with every existing host plugin. All internal processing is done using the internal DSP core and as a result is capable of working with high and low bit depths. The plugin has two main internal cores. Each core is capable of working with up to 8 channels of audio data at any given time. We recommend to

---

use the internal 32 bit DSP card for more efficiency and with it we can utilize a single core and process a maximum of 4 channels of data simultaneously. If for some reason you cannot provide an internal DSP card you can use an external DSP card with at least 32 bits
