I know that 可愛い / かわいい means "cute baby". However, what is the difference between 可愛い and 可愛い? Is there a significant difference between the two? A: I think it's right to say that 可愛い is more polite than 可愛い. 可愛い seems to be more casual. However, 可愛い can be more polite in the sense that it sounds like someone who bows to another. A: Rather than being a static noun, 可愛い, or 可愛い, can be used as a general term to describe a cute child (or older person who is sort of "cute") that you have come across. 可愛い You said/saw that was you. (lit: "That's you") 可愛い You are cute! When you say 可愛い, you sound like you are talking to a child/older person. However, when you say 可愛い, you would sound like you are talking to a grown-up. If you are more of a native speaker, you would probably say 可愛い. Let's say, in the manga/anime you watched, a character said 可愛い to the main character in a "cute" manner. Let's say you want to say that, but

1. Field of the Invention

The present invention relates to a device for testing a thin film, and more particularly to a thin film test device, for instance, for testing both in-plane and out-of-plane behavior of an oxide thin

film. 2. Description of the Prior Art Devices of the kind of the present invention are utilized for testing a thin film having a complex grain structure, for instance, an oxide semiconductor thin film.

Morphology of a thin film having a complex structure, for instance, an oxide semiconductor thin film, may be different from that of an Si semiconductor substrate since the oxide semiconductor thin film is formed on the substrate and affected by the substrate.

Generally, in semiconductor devices made using an oxide semiconductor thin film, the thickness of an oxide

---

semiconductor thin film is preferably less than 100 nm and its area should be large.

Accordingly, for instance, in the case of an oxide semiconductor thin film for a solar battery or an electric field-effect transistor (FET), the thickness of the oxide semiconductor thin film is 10 nm or less. Therefore, in such a case, it is substantially impossible to directly inspect a thin film having such a thickness from above, so that a thin film having a complex structure should be tested by utilizing a test device that can be made compact and that can be well examined. As one of such a

Moving cube with openGL, getting incorrect results I'm trying to make a moving cube, by setting the vertex position and texture coordinates. However, the position is actually moving, but the cube is not drawing properly. The texture is incorrect and some coordinates are incorrect, the positions however work properly. Here is my code:

```
void cube::draw(void)
{
    glVertex3f(-0.5,-0.5,0.0);
    glTexCoord2f(0.0,0.0); glVertex3f(0.5,-0.5,0.0);
    glVertex3f(0.5,0.5,0.0); glTexCoord2f(0.0,1.0);
    glVertex3f(-0.5,0.5,0.0); glVertex3f(-0.5,0.5,0.0);
    glTexCoord2f(1.0,1.0); glVertex3f(-0.5,-0.5,0.0);
}

```

This code is the default function to redraw the scene. The cube is draw per object's push back() function. And here are the coordinates for each vertex:

```
cube::cube(void) { glGen
