Q: Implementing Lenses in Haskell I want to write a Lens library in Haskell. It is a fun challenge, because I wanted to see how close a functional language can come to object-oriented programming. So, there should be four methods, which should be implemented as newtype instance of class Lens from the lens package makeLenses is taking the list of functions and creates a lens over the list makeLenses ctors :: [Lens c a] makeLenses ctor :: [Lens c a] makeLenses r :: [Lens c r] makeLenses rw :: [Lens c r] If you think about making Lenses, I suppose that the first, makeLenses, would be a place to start and I took the list from Haskell lists and created an instance of lens package. makeLenses :: [Functor c] => [(c -> a)] -> Lens c a makeLenses ctors = makeLenses' (map funcToLens ctors) where makeLenses' [] = Id makeLenses' ((f, (k, v)):ts) = ((f.~) k, v) : makeLenses' ts So, a list of functions, which takes a list of functions, create a lens over the list of functions. I used makeLenses' from the lens package and created the makeLenses function In makeLenses' each function is given as a tuple, which is composed as a function and a list. (f, (k, v)):ts This is a kind of list, where the first element is the function and the second element is the tuple. So, if I want to create a lens over a list lenses = makeLenses [\f -> (Id, (f, [])), \g -> (Id, (g,

Patric Young, 22, was taking a photo of some breathtaking scenery at Oakhill, Nevada. But the photo captured one other person who didn't want his picture taken — a "dangerous" mountain lion. Young knew he had a rare encounter up ahead. "The cougar was on the left side, walking up the hill," Young told Business Insider. "I knew it was too risky to get my camera out of my car because the cougar would have tried to jump on my car to get at me. My camera wasn't that big, it's not that high tech. I wasn't going to risk it getting out and running off." Young also knew that it was illegal for someone to be taking photos of the mountain lion, known as "The Cougar of Nevada." So, he took a picture in his phone. "I can't believe I was the only one that got that shot," Young told Business Insider. "I feel really bad about that." The photo Young captured is one of a series showing a cougar hunting around a spotted a woman standing in the open on the Nevada side of the Sierra Nevada. The photographer of those photos was Joseph Ponce De Leon, who photographed the "critical" mountain lion. De Leon said he was feeding the wild cat and it was looking for prey. "He was close to a female mountain lion who was doing her business on my property," De Leon told Business Insider. "I showed her some dead fish and she started eating." But the mountain lion didn't want to let De Leon approach. "I was standing in the middle of the road while she was eating," De Leon told Business Insider. "The cougar paid attention to me. She started getting angry and started growling. I could see that she was stalking me." The photos, which started garnering attention on social media, are not about hunting, De Leon said. "I don't hunt," he said. "I'm a photographer."Q: Differentiate between the GUI app (which is run from UI thread) and the background workers (which run in a different thread) I have read about the concept of threading.Thread and other concepts like it. Also I have been reading about processes and threads and the difference between them. I have seen explanations about the difference between a background worker (GUI app runs in a different
