AutoCAD is a command-line based application and requires a desktop machine with some form of "plug-in" graphics support. Once installed, AutoCAD can be accessed with a command line interface. The command line is not the same as a mouse. To navigate, you point to various objects on the screen by clicking in the desired location and then enter a command. The commands are similar to DOS commands in that you type a command at the command line prompt followed by a command option. For example, to "save" a drawing, you would enter the command "save" followed by the name of the drawing. AutoCAD (and all Autodesk applications) support the use of a mouse, and is not compatible with a keyboard-only interface. Using a mouse with AutoCAD is the most efficient way to create drawings or document editing. AutoCAD includes a "pop-up" menu system which allows you to access a large number of commands and options by "clicking" on the menu. When you "click" an option, it "toggles" between the selected option and a related option. Most commands are accessed from the menu. AutoCAD is available in English, French, German, Japanese, Polish, Portuguese, Spanish, Traditional Chinese, Simplified Chinese, Russian, Greek, Czech, Hungarian, Indonesian, Arabic, Korean, Turkish, Italian, and Thai. AutoCAD has been used in all fields of engineering, architecture, construction, and product design, including: auto design and manufacturing, aviation, electronics, electro-mechanics, geotechnical, graphic design, house construction, information technology, medicine, mining, natural science, mechanical, and manufacturing design. A subset of patients with relapsing-remitting multiple sclerosis (RRMS) develop progressive MS with or without a prior phase of relapsing activity. An optimal treatment regimen for progressive MS is still not defined. Early treatment with the B cell depleting agent rituximab in combination with disease modifying therapy was shown to be beneficial in patients with RRMS with active gadolinium enhancing lesions, and a recent trial demonstrated similar efficacy in a cohort of patients with primary progressive MS. Disease modifying therapy (DMT) with natalizumab was associated with a significant reduction in the number of patients with relapse or disease activity in both RRMS and primary progressive MS. Rituximab, and to a lesser extent natalizumab, were effective in preventing the development of new T2 lesions in patients with RRMS and could, therefore, be of therapeutic benefit in progressive MS patients. However, to date, these agents have not been shown to be effective in halting disease progression. Therefore, alternative treatment strategies must be developed to prevent relapses and dissemination in progressive
