

Loading... In this article, we will show you how to use a common tool called XOR Encryption to encrypt data on an SD card. Instructions will be included to help you modify the card and extract the files when finished. The encryption method may be used on any SD card, but can only be used on Samsung SD cards, since they are not known to be compatible with any other SD card. There are some clear advantages to using encryption, so it is recommended that you encrypt all of your SD cards. The good news is, you can make an SD card that is compatible with your Windows system and any other media players or other SD card readers. Step 2 Insert the SD card into your computer. You will now have to determine where the encrypted data is stored on the card. Read the data on the card with an unencrypted program first to see what is on the card. If you have this information you should be able to find the files elsewhere on the card. Step 3 If you do not know what data is on the card, you will have to work on the encrypted data from the SD card and read the card in another computer. Doing this would mean you have to decrypt the data using some sort of decryption software and then save the files on the SD card. Step 4 Now that you have the files on the SD card, you have to erase the original data from the SD card so that new data can be added to the card. You can erase the data from the SD card using a free program like R-Studio or MediaInfo. However, since you are not completely sure how many times the files will be encrypted, you may want to erase the entire SD card. Step 5 Now you will have to use a special tool to modify the encryption method used to encrypt the SD card. There are two free programs that can do this, and they are referred to as the XOR Encryption Program and the 4 Tools of the Hex Editors. The XOR Encryption Program is a free.it program that requires the card to be loaded in Windows. You can then edit and save the files on the card. This program will be the easiest to use in the long run. It is also recommended to use a program like Windows Explorer since it will make searching for files on the SD card easier. The 4 Tools of the Hex Editors are different free programs that need the card to be loaded in Windows.
