The Lord of the Rings: The Fellowship of the Ring (VVS: The Lord of the Rings: The Fellowship of the Ring) 2001 1. The Lord of the Rings is originally called The Lord of the Rings, not The Fellowship of the Ring. The title of the film was also changed to "Lord of the Rings: The Fellowship of the Ring" in honor of the first edition.

Testing for a certain
character in a string,
Python I'm trying to test if
a character string of the
given character is in a

string, for example if the character is '?'. Is there an easy way to do this? I'm trying to get an empty result if the character is not found. A: In case of? you should use in operator: >>> "A" in "A?" True >>> "?" in "A?" True >>> "?" in "B?" False In case you want to check if it is in list use isin: >>> "B" in ["A", "C", "?"] True >>> "C" in ["A", "B", "?"]

False A: You can use `in` to check if a string contains another string: `>>> "?" in "B"` True `>>> "B" in "B?"`

False `>>> "?" in "B?"`

False To understand it better consider a step-by-step example `>>> a = "B"` `>>> "?" in a` False `>>> "?" in b` False `>>> "?" in c` False here `b` and `c` are empty strings, so `"?"` isn't in `b` or `c` but in `a`. If you want to check for

instance if a string contains all letters with values 0-9 you could use all: >>> "B"? False >>> all("B" in x for x in xrange(10)) True This returns True for a and False for b. If you want to check if all characters from a character set are contained you could use "?".join(set(c) for c in "AB") E.g. >>> "ABC"? False >>>

"".join(set("ABC")) 'A' If
you want to check if the
string contains only one
character you can use is
to check if your string only
contains one character:
>>> '?' in "A?" False >>>
'?' in "B?" True >>> '?' in
c False Crucial roles of ATP
