Available torrents in our list. movie pk hd 720p download full movies free.Q: How to check if the word is present in the list of words and not present on the list of sentences I have two lists of sentences and words respectively. A sentence can be present on the list of

words as well as the list of sentences. Now I need to check if a word is present in the list of words AND it is not present in the list of sentences. If it is present in the list of words AND also present in the list of sentences then it should be counted as present. If it is present in the list of sentences AND it is not present in the list of words then it should be counted as present. To check if it is present in the list of words I have used the == operator. Now I have no idea how to check whether it is present in the list of sentences. The code i have used is : return ((word_dict.get(word_list.index(word), 0)) == 1) word_list = [""]*100 word_dict = dict() A: It should be something like this I guess. word_list = [""]*100 word_dict = dict() sentences = ["This is a sentence", "another sentence"] for sentence in sentences: for word in sentence.split(): if word in word c6a93da74d
