You can purchase a new copy of Lightroom, or update to the latest version of your current version, via the App Store on your Mac or via the Adobe website. With Lightroom 5, you can import your existing photography and videos into the new app quite easily. The other "new" features of this update are listed below. Lightroom is easy to use and can be overwhelming for new users, especially those who are not familiar with editing software. In Lightroom, a rocket-ship-like information panel can suggest what settings should be used in your photo. The options are clearly described, and are adjustable through sliders, switches, and clicks. There are two add-ons one can purchase that allow you to work faster. Images in your library can be formatted to fit either a 4K or 8K resolution and one can purchase the Eye Shape function, which can be replaced with a violet or blue filter. Enhance Photo might be a technological term thrown around too much these days, and it can easily become a buzzword. The truth is that the word isn't really used all that often when talking about photo altering applications or plugins. If anything, it tends to be used more for "digital" projects or to talk about a corporate website or a group of products. Almost all of the photo editing tools are present in Lightroom, and you might not have known you needed them or only wanted them. However, Photoshop is the Photoshop. If you have a friend who uses Photoshop and complains about it, you probably won't want to use it. The two tools that could be ignored the most by novice users are make something that looks fresh feature, and the ability to make a selection. In Lightroom you can make a selection in one click while in Photoshop this might take two or three.

Most people call the Gradient Palette "the Gradient Panel." You can now apply a gradient to both a shadow and a highlight of the image, or an effect to either a shadow or highlight in an image. This lets you create a realistic, 3D-looking effect, which is fantastic for objects in your image. The Gradient tool also allows you to manipulate the gradient itself and apply multiple solid colors to the gradient, or set the gradient to fade from one color to another. With the new browser and its support for web standards, you don't have to be stuck with a specific browser anymore. If you use Google Chrome then you can use the web application, or if you use Firefox then I recommend using the Firefox Add-on called: Photoshop-CS6 . The Firefox application works great and not only that, but it is fully scriptable and supports all the features that you would expect in the desktop application. If you want to try the new Photoshop for a week, you can download the files from GitHub for yourself to understand all the features of the application. One of the biggest shifts from 2018 to 2019 is that Adobe has started to move everything over to the Native GPU platform. Products built on the Native GPU platform such as Adobe Camera Raw, Photoshop and After Effects are now being built using hardware accelerated pipelines. For everyone else, Adobe Motion will still be a global standard for broadcast content. It will act as an extension of Adobe Premier - however for those needing a global, process-driven workflow for broadcast, Adobe Motion is the go-to end choice. Note, that all these features are also coming to the Windows platform, and starting with release 2018.3 there is a concerted effort by Adobe to make Photoshop even more accessible for the millions of users of Windows 10. More updates will follow. In our previous post in this series we discussed the developments in 2018 that we think have the greatest impact and effect on video editing in 2019. Now onto what we think the top 5 things to expect from 2019.
