## What's New in the Notepad.NET?

A lightweight and portable text editor with a default look. This allows you to use it in almost all Windows environments. Notepad.NET Screenshots: Download Notepad.NETQ: Is it possible to disable Java programmatically? I would like to run a Java program, but only allow it to be run on a single computer. Is it possible to run Java programs without installing them? A: You can use this method (credits: James Strachan) to detect Java versions that are on the computer: String javaExe = System.getenv("JAVA\_HOME"); if (javaExe!= null &&javaExe.isEmpty()) { try { javax.tools.JavaCompiler.Main.main(new String[] {"-version", "-showversion", javaExe}); System.exit(0); } catch (NoClassDefFoundError e) { System.err.println("Java version is too old"); System.exit(1); } catch (IOException e) { System.err.println("Java version is too old"); System.exit(1); } catch (RuntimeException e) { System.err.println("Java version is too old"); System.exit(1); } } A: I don't know if it is possible to programmatically disable Java, but the alternative to allowing it to run is to create a restricted user and grant that user permissions on a Java run time. This should be restricted to a single machine and should prevent any Java usage. A: You can use psitunes to run the application and prevent it from running if Java is not installed. You can download the psitunes package from here, and it is freely available for evaluation. For a quick install type wget unzip psitunes.zip mv psitunes.app /Applications/ This will give you the psitunes app icon, from which you can launch psitunes and try the tutorial in the "Configuring psitunes" section. The executable for the application is in the psitunes.app/Contents/MacOS/psitunes. I have not tested this app myself, but it seems to be doing what it promises to do.
