After many years, Photoshop finally had a stable API for real world rendering and most modern computer systems are capable of the rendering of up to 64K shading transforms. This allowed for a new feature set of the graphical rendering with Photoshop and the introduction of new features such as real-time previews during editing, more accurate layer masks, and even opacity and color for selection. Finally, a few tools have returned, such as the pathfinder. However, some old style tools such as the Levels tool have not been included for those updating to Mac OS X, the new MacOS Sierra, or even Windows 10. As Mac users, this is mainly a disappointment because programs such as the Levels tool are helpful in adjusting the red, white, and blue intensities of an image during a color correction. Rather than trying to reproduce these functions within a program such as Lightroom, a simple adjustment can be made within Photoshop without any help from another app.

With the Clipping Mask feature, this allows for additional editing from the exported file, without needing to first export to a new file.
