Banner Maker 1.1.0 is the best tool to create attractive and professional looking banners. It has built in templates that will give you.Q: Why does a compiler warn me about not using a case clause in a switch statement? I don't understand why the compiler gives the warning. switch(x){ case 1: return "value 1"; case 2: return "value 2"; case 3: return "value 3"; default: return "default"; } Why does the compiler give a warning like this: Warning 2 Unreachable code detected and not an error? A: The switch statement is not allowed in a void function, and not allowed in a return statement either. This was a feature in the early C and early C++ compilers. Nowadays, switch statements are not allowed to branch (except in C++). A: From section 14.2.3 of the C standard (emphasis mine): A return statement with an expression that has a value of type void, such as: return; The value of a return statement is implementation-defined, except for the following cases: A return statement without an expression performs no function other than terminating the full-expression, provided it is executed; this definition allows a return statement to be used as a statement (an idiom sometimes known as the “empty statement”). If the expression is the name of a void function, the function denoted by the name is called with the same parameter-expression sequence as the return statement; if this is a constructor call, and the object being constructed has static storage duration, the completion status of the call is an implementation-defined nonzero value. If a full-expression is conditionally executed based on the result of an expression that has void type, the behavior is undefined. The statement f988f36e3a
