

3 Bodas De Mas 1080p Megapixelsl

La Cámara de Foto Digital Vídeo de los Niños 1.2 Megapíxeles 1080p. O puede almacenar las imágenes en un disco externo, aunque .The conventional method for forming an electrical connector is firstly to prepare a terminal, then to insert the terminals into a terminal receiving chamber of a metal shell and then to form a sheet metal cover for enclosing the terminal assembly. However, in the conventional electrical connector, the sheet metal cover normally is equipped at its front end with a gutter corresponding to the shape of the terminal, the sheet metal cover is then bent in the shape of a trough, and the terminal is then further inserted into the trough of the sheet metal cover. After forming the sheet metal cover, there are still a number of gaps between the sheet metal cover and the terminal. Also, there is no device for keeping the sheet metal cover from falling out of a row of terminals. Moreover, in such process, the sheet metal cover is thin and the cover is weak and brittle, so that the cover is easy to be broken. Because of the above drawbacks, when the terminals are assembled into the electrical connector, the sheet metal cover has to be inserted into the electrical connector one by one, so that the production process is troublesome and the production rate is low. In addition, the terminal is made by processing, and the sheet metal cover is often affected by the forming process, so that the gaps are formed between the sheet metal cover and the terminal. Also, when the sheet metal cover is inserted into the electrical connector, the cover will become large with a height equal to the height of the connector and the height of the gutter, and the volume of the electrical connector will be increased, and the electrical connector cannot be reduced in size. Thus, there is a need of providing a new electrical connector and gutter assembly so as to overcome the above drawbacks. The present invention relates to a low-noise, high-resolution magnetic-disk medium-read-device operating as a stationary head. Data are stored on hard disk by magnetic domains in the disk surface being magnetized or demagnetized as required. To read out the data stored on the disk, the sensing element, typically an MR transducer, is biased such that the read head floats a distance of only a few atomic layers from the surface of the disk. In the initial portion of the read operation, the
