The Camera Raw module that we know and love from Photoshop is integrated. It is even clever enough to know when you exit the image browser to a different location. Here is how it transfers the image. If you have your iPad away from your Mac, the images are stored in iCloud, accessible from any newer iPad or iPhone. Lightroom uses the Camera Raw module for all image edits, such as contrast, color, and other adjustments. Photoshop users are familiar with this, but with a few exceptions, all adjustments in the edits panels from Lightroom are identical to what you can do in the Photoshop CS6 Camera Raw. If you prefer editing in the Photoshop application, you can change your mind by disabling the integration and using it that way. Lightroom is not just for photos or collections. You can also use it as a video editor. It is not as powerful as Adobe's Premiere Pro, however. Premiere Pro is a professional video editor. Still, it is at least adequate for handling, among other things, video clips stored in YouTube. Lightroom doesn't have a feature to easily generate thumbnails, so images become difficult to quickly scour if many images are in the database. With the new Camera Raw Views feature, you can easily create thumbnails of the image browser's images. You use the same interface as the Photoshop CS6 Camera Raw, and you have a separate panel that provides visual feedback, so you know the progress. Lightroom has several panels for image optimization. This is not a problem for most photographers, however. I was disappointed to find that the Color Profiles and the Tone Mapping panels do not work in conjunction with each other. The Color Profiles panel shows you the image's color balance, and the Tone Mapping panel shows you the image's tonal range.

Utilizing the EM C toolset, we were able to re-create all of the features in Photoshop and the rest of the desktop suite in Emscripten, which was a challenge in itself, due to the high level of abstraction required to run the desktop software in the browser... e3d0a04c9c
